PROFESSIONAL SUMMARY

Data Analyst with **four end-to-end projects** across fraud, retail, lending and inventory, using SQL, Excel, Power BI, Python, Tableau, Databricks and Snowflake. Checks the numbers before they reach a report: **caught model leakage, a wrong default-rate denominator, a suspected £38,970 entry error and invalid product IDs.** Freelance data annotator at Innodata. HackerRank-certified in SQL (Advanced).

TECHNICAL SKILLS

SQL & Python: SQL (joins, CTEs, subqueries, window functions), Python (Pandas, NumPy, scikit-learn), PySpark, ETL pipelines
Business Intelligence: Power BI (DAX, Power Query, data modeling, time intelligence), Tableau, data visualization, KPI dashboards
Analytics: Data-quality checks, control testing, threshold analysis, logistic regression, random forest, RFM, cohort analysis
Data Platforms: Databricks (Bronze/Silver/Gold), Snowflake (RAW/STAGING/ANALYTICS), SQL Server, MySQL, Alteryx
Data Integrity: Data cleaning, deduplication, cross-layer reconciliation, referential integrity, exception logging, salted SHA-256 hashing
AI & Tools: Local LLMs (Ollama, Qwen3), JSON schema validation, Advanced Excel (PivotTables, XLOOKUP), Jupyter, Git/GitHub

EXPERIENCE

Innodata India Pvt. Ltd. | Data Annotator | Remote, freelance contract Jul 2026 - Present

- Review AI-generated charts, dashboards and reports for client AI projects, checking that each one matches its source data.
- Validate axes, labels, titles and written insights against the underlying numbers, and fix errors before client delivery.
- Test interactive dashboard controls and rate 20–30 outputs a day against documented client requirements; selected for cross-skilling.

PROJECTS

Payment Transaction Controls & Fraud Risk Analytics github.com/beingbrute/payment-fraud-risk-analytics

Databricks (PySpark, SQL), Alteryx, Python (scikit-learn), Power BI, Tableau, Excel · 2026

- Compared fraud rules with ML on 6,362,620 PaySim transactions: Bronze/Silver/Gold Databricks pipeline with salted SHA-256 IDs, reconciled per layer. Six data-quality checks found 4.24% of rows at 12x the 0.13% fraud rate and 16 non-positive amounts, all fraud.
- Tested five SQL fraud controls for precision and recall, with a threshold trade-off. The two best caught about half of all fraud at 70.46% and 64.67% precision; two more, rebuilt in Alteryx, matched SQL exactly.
- Trained logistic regression and random forest on a time-based split and treated the forest's perfect score as leakage. On the same test window the best rules hit 100% and 98.65% precision vs 52.16% for logistic regression, at about half the recall.
- Recommended keeping the two best rules, retiring one that flagged 2.49M transactions for 45 frauds, and using logistic regression to rank alerts. Backed by a 25-row sample review in Excel, an RBI-based memo, Power BI and Tableau.

Customer Revenue & Retention Analytics github.com/beingbrute/Customer-Revenue-Retention-Analytics

Python, Pandas, SQL, Snowflake, Tableau, GenAI (Ollama / Qwen3) · 2026

- Analyzed revenue and retention for a UK online retailer. Merged two overlapping files (1,067,371 rows) in Python, removed 34,335 duplicates and flagged a suspected £38,970 entry error instead of deleting it.
- Loaded 1,033,036 records into Snowflake RAW, STAGING and ANALYTICS, reconciled at each layer. Classified 4,725 products into 12 categories with a local LLM (Qwen3 via Ollama), checked with JSON schema and rules.
- RFM and cohort analysis of 5,852 customers: Champions were 24.74% of customers but 74.04% of identified-customer revenue; 27.65% never bought again, so recommended testing a 30-day follow-up. Two Tableau Public dashboards.

Loan Default Risk Analysis github.com/beingbrute/Loan-Default-Risk-Analysis

Power BI, Power Query, DAX, Data Modeling, Time Intelligence · 2026

- Built a four-page Power BI report on 255,347 loans showing who defaults (young adults: 19.71%) and how much value is at risk: date table, YTD/YoY DAX, field parameters, tooltips, decomposition tree.
- Caught a wrong denominator in the first version (group defaults divided by all loans), rebuilt it as one default-rate measure and checked every KPI against source. Defaults were 11.61% by count but 13.15% by value, so recommended sizing exposure by value.

Inventory Demand & Supply Analysis github.com/beingbrute/Inventory-Demand-Supply-Analysis

Power BI, SQL Server, MySQL, DAX, Power Query · 2026

- Found and fixed a referential integrity break in the simulated production inventory data. Then migrated the report source from SQL Server to MySQL and revalidated the Power BI report after the switch.
- Built DAX measures for demand fulfilment (79.97%), unfulfilled units (746) and revenue at risk ($97.37K). The products with the largest shortages were not always the ones with the most revenue at risk.
- Recommended reorder points for the top 10 products by revenue at risk, with demand and value fulfilment tracked as paired KPIs.

EDUCATION

B.Tech, Computer Science and Engineering | UIET, CSJM University, Kanpur 2019 - 2023

CERTIFICATIONS

HackerRank Certified: SQL (Advanced), Python (Basic), R (Intermediate) | Verify on HackerRank Oct 2026

HackerRank Badges: SQL 5-Star Gold, Python 5-Star Gold
